

How Chainlink Analytics Works

Chainlink Analytics System Overview

Chainlink Analytics is a data intelligence platform built specifically for beverage distributors. It takes the data you already have and turns it into actionable insights that help your team sell more and work smarter. Here is how it all fits together.

The Big Picture

Everything in Chainlink starts with your data. There are two phases: loading your company data, and uploading your operational files. Once your foundation is in place, the platform handles the rest — matching products, calculating gaps, generating reports, and surfacing insights through AI.

Step 1 — Load Your Company Data

Company data is the foundation of everything in Chainlink. It needs to be loaded before your operational uploads will work correctly. Update it whenever your accounts, products, or territory change.

Customers

Your customer file is the master list of every store you service — chain name, store number, store name, address, city, county, and assigned salesperson. Chainlink uses this to automatically fill in store details whenever you upload a distribution grid or reset schedule.

Products

Your product catalog lists every SKU you carry — product name, supplier/manufacturer, package size, and UPC code. Chainlink uses this to automatically match UPC codes in your distribution grid to product names and manufacturer information.

Sales Reports

Your weekly sales report shows what actually sold at each store. Chainlink compares this against your distribution grid to find the gaps — authorized products that are not being purchased. Upload this every week to keep your gap reports current.

Supplier by County

The supplier by county file maps which suppliers have territory rights in which counties. This powers Placement Intelligence — showing you which products are in authorized territory and which placements represent real distribution wins.

Step 2 — Upload Your Operational Data

Operational data is uploaded on a regular cycle — seasonally for distribution grids and reset schedules. These files drive your gap reports and sales team assignments.

Distribution Grid

Your distro grid tells Chainlink which products are authorized at each store for each chain. This is the foundation of gap reporting — without it, there is nothing to compare your sales against. Upload a new grid at the start of each season or when your schematic changes.

Reset Schedule

Your reset schedule tells the system when and where your team is scheduled to reset product displays. This feeds into gap reporting so you can prioritize stores with upcoming resets and make sure your team has the right information before they walk in the door.

Step 3 — Chainlink Processes Your Data

After each upload, Chainlink automatically:

- Matches products to your catalog using UPC codes
 - Fills in store details (name, address, county) from your customer records
 - Calculates which authorized products are not showing up in sales
 - Tags gaps by chain, store, county, salesperson, and product
 - Updates your gap history so you can track progress over time
-

Step 4 — You Get Insights

Gap Reports

See every authorized product not yet sold — filtered any way you need: by chain, store, county, salesperson, or product. Export to Excel with one click. Each rep gets a coaching note powered by Chainlink AI summarizing their gap situation.

Chainlink AI

Ask questions about your data in plain English. Chainlink AI queries your database directly and answers in seconds — no technical knowledge required. Ask things like 'Which salesperson has the most gaps this week?' or 'Show me Save Mart stores missing High Brew Coffee.'

Placement Intelligence

Compare your current distribution grid against a previous season to see which products were added, removed, or unchanged at each store. Track your distribution progress over time.

■ *All insights are scoped to your account only — your data is never visible to other Chainlink customers.*

Your Data Is Always Secure

Chainlink Analytics runs on Snowflake — one of the most secure and reliable cloud data platforms available. Your data is isolated to your account, encrypted at rest and in transit, and never shared with other customers.
